Overview

- What happened during March 11-16?
- Monitoring of radiation activities
- Cancer risk
- Radioactive contamination in seafood.

Ground subsidence

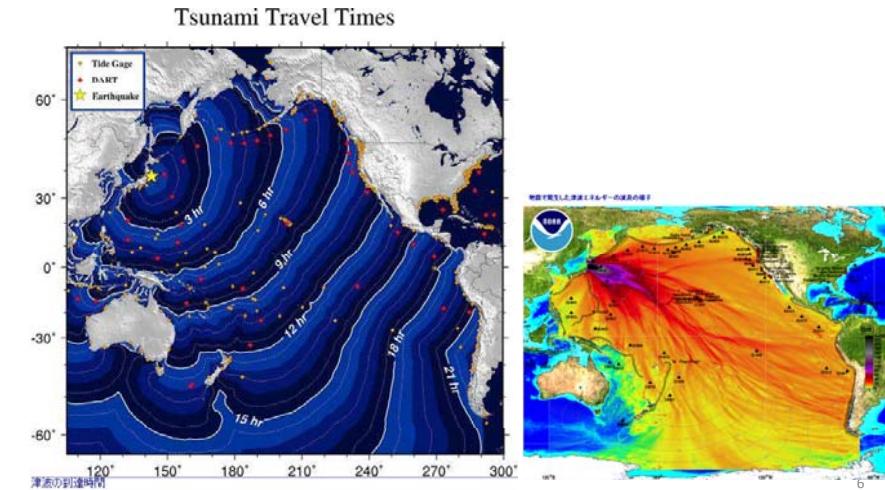

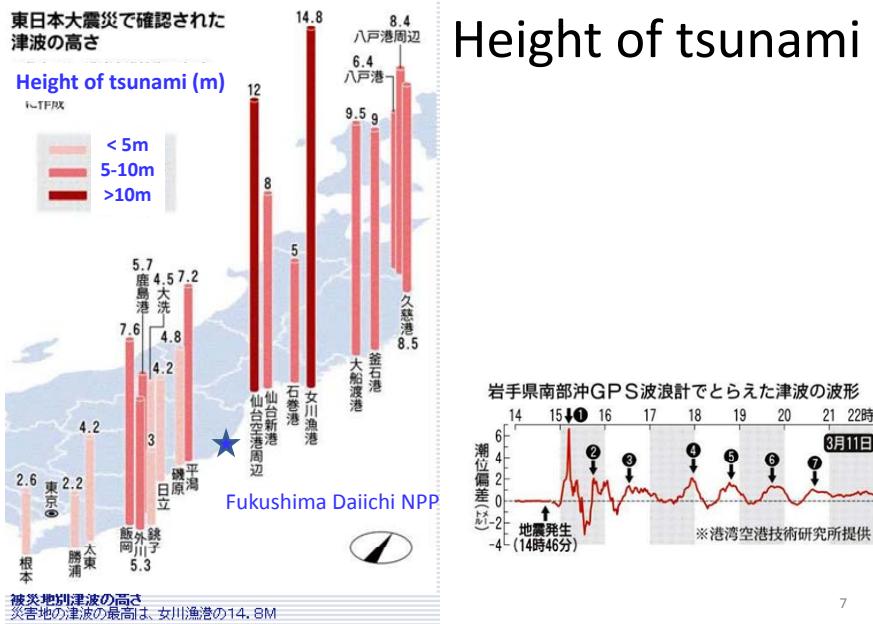

Tsunami attacked

Tsunami travel time

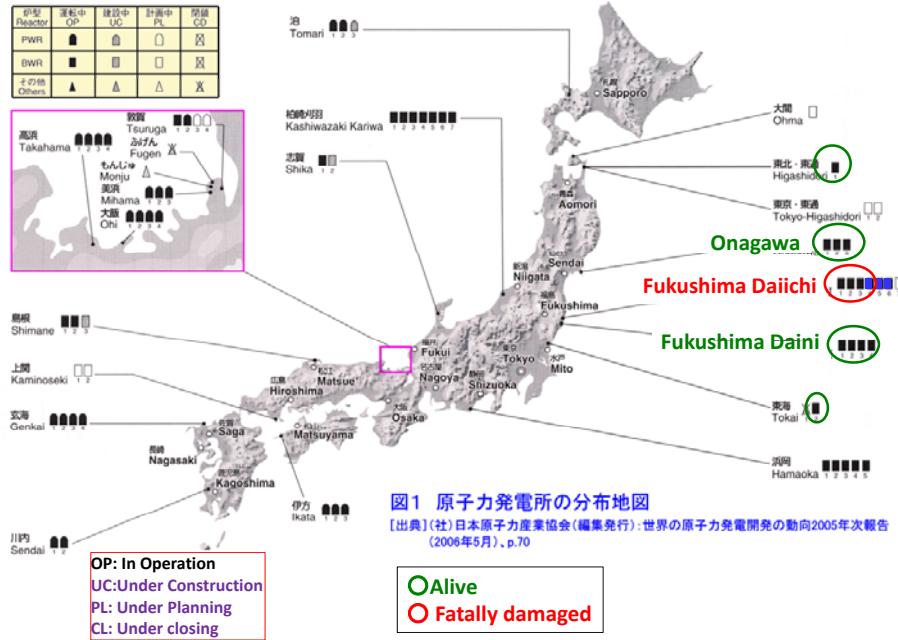

Height of tsunami

Haramachi Thermal Power Plant was damaged by tsunami

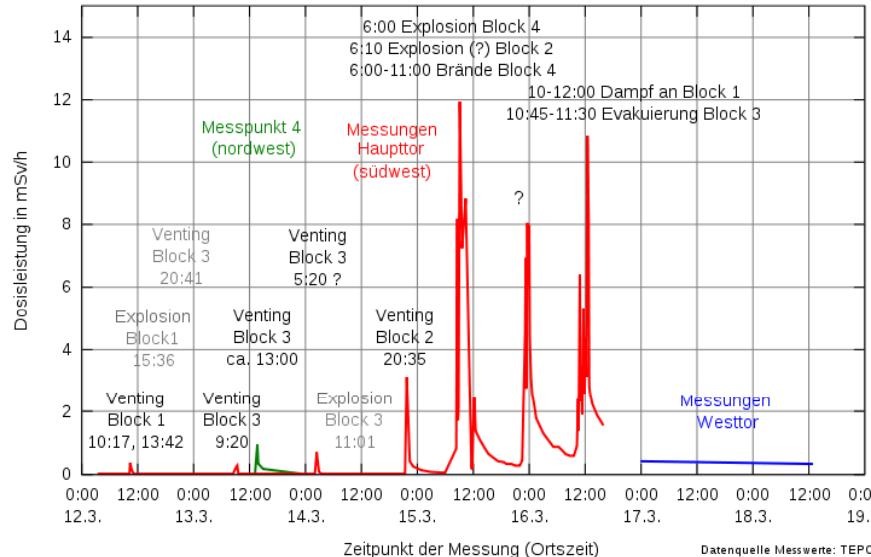

Timetable of Fukushima Daiichi NPP accident

- 3.11 14:46: Nuclear reactors 1, 2, and 3 were automatically shut down by the shake. Reactors 4, 5, and 6 were undergoing routine maintenance and were not operating, (reactor 4 was defueled in November 2010). Units 1 and 2 were not operating correctly and notified the proper officials.
- 3.11 ca 15:46: A 14m tsunami overtopped the seawall (5.7m) disabling the backup diesel generators. The automatic depressurization systems all failed.
- 3.12 15:36: A massive explosion in the outer structure of unit 1 happened, four workers were injured.
- 3.14 11:01: Unit 3 reactor bldg exploded, injuring six workers.
- 3.16 ca14:30 The fuel rod storage pool of unit 4 may have begun boiling. 18:00 Workers had been withdrawn because of the radiation rising to 1000 mSv/h.

Radiation release on March 14

<http://online.itp.ucsb.edu/online/lecture/bmonreal11/>

Release of radioactive contamination to seawater

categories	Total emission	Max. concentration
Direct emission	3.5 ± 0.7 PBq	68kBq/L
From Atmosphere	ca.80% of 15PBq	
Planned low-level contaminated water release	0.000042PBq	

Megafloat for cooling water tanks

20

Key points

- Radioactive contaminations of I-131, Cs-137, Cs-134 are mainly concerned.
- Meltdown occurred in reactors 1, 2 and 3.
- Nuclear fuel fired in unit 4 during March 15-16.
- Major source of atmosphere contamination is explosion of units 1-4 on March 15-16.
- Major source of seawater contamination is emission by a hole into the pit near reactor 2 that was blocked by water glass on April 6 morning.

Ministry of Agriculture's campaign
“Support Eastern Japan by eating foods”

<http://yellow.ap.teacup.com/thinkmon/1194.html>

http://pub.ne.jp/newjei/?entry_id=38

Discrimination to radioactive contamination

- Discrimination in even the Kyoto traditional religious events
- Pine woods with prayers' message, almost no contaminated, were rejected to be burn in Kyoto religious event (August 16, 2011)
- Garage sales of agriculture/fisheries products of Fukushima in Fukuoka was cancelled.

No control of domestic/wild animals

- Snake thief

26

Problems of wildlife in Japan

- Recent concerns of wildlife management in Japan is not extinction, but “**over-abundance**” of deer, monkeys and boars, all of which inhabits near Fukushima Daiichi NPP.
- Human excluded zone (20km zone) is a “**heaven**” of wildlife despite of radioactive contamination
- Wildlife may threat damage on agriculture outside of the 20km zone.
- We cannot catch them in the 20km zone.

Wildlife defies Chernobyl radiation

By Stephen Mulvey
BBC News

It contains some of the most contaminated land in the world, yet it has become a haven for wildlife - a nature reserve in all but name.

The exclusion zone around the Chernobyl nuclear power station is teeming with life. As humans were evacuated from the area 20 years ago, animals moved in. Existing populations multiplied and species not seen for decades, such as the lynx and eagle owl, began to return.

There are even tantalising footprints of a bear, an animal that has not trodden this part of Ukraine for centuries.

"Animals don't seem to sense radiation and will occupy an area regardless of the radiation condition," says radiobiologist Sergey Gaschak.

"A lot of birds are nesting inside the sarcophagus," he adds, referring to the steel and concrete shield erected over the reactor that exploded in 1986.

National Geographic News April 26, 2011

チェルノブイリ原発事故の居住禁止区域内に生息するヘラジカ(2011年3月撮影)。既に有蹄類(ゆうているい)の生息数は回復し、突然変異もほとんど見られない。しかし、ヘラジカのような草食動物の場合、体内の放射性物質レベルがかなり高くなっている。規制から外れたエリマでも同様だ。

草食動物によく放射性物質を摂り込む地衣類やナノ藻をエリにする。事故当時、ノルウェーで解体された草食動物の肉から、1キログラムあたり約1万4000ベクレルの放射能が検出された。食用肉の規制標準の2倍を超えており、隣のスウェーデンなら46倍に相当する。心配ないレベルだが、今でもノルウェーのトナカイ肉からは放射性セシウムがなくならない。

居住禁止区域内では、食肉に追われる恐れがない。草食動物がのひと暮らしている。しかし、絶えず放射線にさらされており、汚染された草や地衣類を摂取してさらに体内に取り込んでいく。ただし理論上は、害を及ぼすなどの線量率ではない。イギリスにあるボーリングマス大学の水環境学者ジョン・ミス氏は、「集団規模で影響は出ないだろう」と話す。

How long should we mind? Lessons from Chernobyl

Cs-134/137

Total exposure (mSv/yr) and cancer risk (%)

- Major source of exposure is external at least >20km far from Fukushima Daiichi NPP.
- Exposure from foods depends on person (to buy or not products of Fukushima)

Place	External	Respir- ation	Drink	Foods	soil	Total (mSv/yr)	Cancer Risk (%)
Fuku- shima city	8.0	~1.0	0.03	1.01	<0.5	11	0.06
Tokyo	0.13	~0	~0	0.37	~0	0.5	0.003

38

Conclusion

- I-131 Physical half-life period (HLP) = 8 days. **Seaweeds** may be highly contaminated, but it is effective to prevent I-131 from thyroid.
- Cs: Biological HLP = ca. 50 days. **Some ground fish is still contaminated**. Check inspection data! Keep the interim standard (500Bq/kg for Cs-134 & Cs-137, 2kBq/kg for I-131)
- Sr-90: Physical HLP = 28.8yrs; accumulated into bones. Japanese do not eat bone of tunas!
- Pu: very low concentration.

39

Conclusions by Ben Montreal (March 14)

- The worst general-public effects of Chernobyl were stress/fear; HUGE education/communication failure
 - You have the information: count the millisieverts and decide how to respond
- My feeling: the worst-case radiation hazards from Fukushima are mitigatable and local
 - (early evacuation + controls on ^{131}I in food)
- My feeling: the global radiation hazard is nil.
 - The best way to reduce worldwide low-level radiation releases is ... stop burning coal
- Save your energy for those affected by the tsunami and “50 plant workers” at Fukushima
